CRACK THE CODE

TALK Check

You've got the system for what to say.

This is how to show up when you say it.

T- TONE: One breath. Warm first word.

A- ATTENTION: Name early. Soft eye contact.

L- LANGUAGE: One idea. Max 18 words.

K- KINETICS: Open body. Still on key lines.

Jungian Psychology + Systematic Frameworks

Built by an introvert. For introverts.

Where This Fits

The Delivery Layer

The Fearless Approach System gave you the architecture, when to approach, how to read a room, and how to build real connection. TALK Check is what runs underneath all of that.

It is the 10-second delivery layer you activate before any conversation. Your tone, attention, language, and body set the entire foundation for what follows, before a single word of strategy leaves your mouth.

You can know exactly what to say and still lose someone in the first three seconds because your tone signals anxiety, your eye contact disappears, or you talk past your own point. TALK Check closes that gap.

The Routine

Run This Before Every Conversation

In-person. On camera. On the phone. Before a networking event, a difficult conversation, a first impression. Every time.

T- TONE: Take one breath → warm first word ready

A- ATTENTION: Their name in mind → eye contact focused

L- LANGUAGE: First sentence planned → one idea, under 18 words

K- KINETICS: Shoulders down → hands at navel → still on key line

Example Execution

[Breath] **"Ayo"** *(beat + eye contact)* "Today we're focusing on one skill." *[go still]* **"Clear openings."**

T: Warm opener after breath · A: Eye contact held during pause · L: Two sentences, 11 words total · K: Still on "clear openings"

The Science

Why the First Three Seconds Decide Everything

Research from the University of Glasgow shows people form personality impressions within 300 to 500 milliseconds of hearing someone say hello. Before you finish your opening word, they have already decided if you are trustworthy, confident, or anxious.

This is not about faking confidence. It is about removing the signals that contradict your actual competence. Introverts especially, you have done the thinking, and you have the depth. TALK Check makes sure your delivery does not undercut what you actually know.

The Jungian Layer

Carl Jung called this conscious persona development, deliberately building the part of yourself that engages with the world, instead of hoping it develops on its own.

Most people let their social persona develop randomly through trial, error, and accumulated awkwardness. TALK Check is you doing it consciously. That is not fake; that is exactly what Jung meant by individuation: integrating all parts of yourself into a whole, capable person.

"Until you make the unconscious conscious, it will direct your life, and you will call it fate."

— Carl Jung

TALK Check is that process applied to social engagement. You are not performing; you are consciously developing your delivery instead of letting anxiety run it for you.

Recognition

The 5 Ways It Goes Wrong

If you have ever left a conversation thinking that went sideways and you are not sure why, one of these five was the reason.

RUSHING You jumped in before your first word was ready. Fast pace, no breath, anxiety leaking through your speed.	**The Fix** Write your first word before you start. Look at it. Breathe once. Then say it.
RAMBLING You started talking and could not find the period. Three ideas inside one sentence, their eyes glazing over.	**The Fix** Add a mental period every eight to twelve words. Force the pause. Start the next sentence fresh.
FIDGETING Shifting weight, hands moving constantly, random gestures that broadcast anxiety before you have said a word.	**The Fix** Plant your feet. Hands to navel line. Only gesture on nouns and verbs, then return to neutral.
FILLER WORDS "Um," "like," "basically," "you know", every filler erodes the authority you actually have.	**The Fix** Use a short bridge: "Here's the point," "Quick note," or "Bottom line." Then continue.
MONOTONE Flat delivery makes even smart content disappear. People disengage from tone before they disengage from content.	**The Fix** Smile while speaking, it changes your vocal quality even on the phone. Emphasize one word per sentence with a pitch shift.

The Full Breakdown

Each Element - Science and Mechanics

T- TONE: Set Safety and Trust Immediately

Research from the University of Glasgow shows vocal impressions form within 300 to 500 milliseconds — before you finish saying hello. Your tone activates trustworthiness and confidence judgments instantly.

The pre-speech breath: Activates your parasympathetic nervous system. Prevents rushing. Make your first word land controlled, not panicked.

Warm first word: "Hey," "Hi," "Ayo" with rising intonation. Not a flat "Hello" or jumping straight to business.

Steady pace: Too fast signals anxiety. Too slow signals condescension. Conversational rhythm with natural pauses is the target.

Pitch variation: Avoid monotone. Emphasizing key words with a slight pitch shift makes you sound more trustworthy and engaged.

A- ATTENTION: Build Trust Through Recognition

The brain's amygdala processes within milliseconds whether someone seems safe or threatening, based on attention cues. Name use and eye contact trigger personal recognition and activate rapport before the conversation has properly started.

Name timing: Say their name within the first ten to fifteen seconds. The pause after it, "Hey Sarah [beat]", signals genuine recognition, not a scripted greeting.

Eye contact in person: Hold for three to five seconds, then break naturally. Sixty to seventy percent during conversation. Not constant staring.

On camera: Look at the camera lens, not the screen. Position the camera at eye level so you are not looking down.

On the phone: No eye contact available, compensate with vocal cues. Use their name more. Add acknowledgements like "I hear you."

L- LANGUAGE: Lower Mental Load, Increase Clarity

Cognitive load theory shows that working memory can only process a limited amount of information at once. Long sentences force listeners to hold earlier words in memory while waiting for the end; they miss your point or disengage before you finish.

The 18-word rule: Maximum eighteen words per sentence. Average adult working memory holds seven chunks. Do not exceed it.

One idea per sentence: "I have a proposal. It involves changing our process. Here's why it matters." Not one long run-on sentence that loses them in the middle.

Concrete over abstract: "We will meet Tuesday at 3 pm" beats "we should synergize soon." Specific and clear every time.

Reading comprehension: They nod? Your language is landing. Blank look? Simplify. Interrupting to finish your sentences? You are being too wordy.

K- KINETICS: Make Your Words Believable

Nonverbal cues often carry more weight than words. Posture, gesture, and body carriage signal confidence or anxiety before you have said anything meaningful.

Shoulders down and back: Raised shoulders signal anxiety even when your words do not. Consciously drop them before you start.

Hands at navel line: The navel zone, between the belly button and chest, signals grounded and controlled. Hands higher signal nervousness. Hands in pockets signal disengagement.

Strategic stillness: When you deliver your key message, stop moving. Stillness signals that this matters; pay attention. Movement dilutes impact.

Deliberate gestures: Gesture on nouns and verbs only. Return to neutral after. Never gesture on filler words; it becomes visual noise.

When to Deploy

TALK Check Runs Before Everything

In-person. On camera. On the phone. Difficult conversations. High-stakes impressions. Run it every time.

In-Person Conversations	Networking events, meetings, social situations, any time you approach or are approached.
Video Calls	Look at the lens, not the screen. Camera at eye level. Take a breath before you hit join.
Phone Calls	Tone is your only tool here. The pre-speech breath matters even more when they cannot see you.
Difficult Conversations	When delivery matters most, TALK Check matters most. Give it more than ten seconds if you need it.
On Camera Content	Run it before every take. Warm tone, camera contact, and short, clean sentences project authority.
High-Stakes First Impressions	Job interviews, important introductions, anything where the first impression sticks, run TALK Check before you walk in.

What's Next

You now have the foundation. Every conversation you enter from here, you have a system running before a word leaves your mouth.

Follow @GetSocialCode. Free. No filler. Just the systems introverts never got.

Social Code: Crack the Code

First impression formation — Ambady & Rosenthal, 1992 · Vocal trust perception — McAleer et al., 2014 · Cognitive load theory — Sweller, 1988 · Nonverbal communication — Mehrabian, 1971 · Jungian psychology — Carl Jung: Persona & Individuation · Neuroscience of breathing — Huberman, Stanford

WHAT'S NEXT

The next problem most people hit after this:

They can't stop replaying it.

You approached. The conversation went well.
Then you spent three days replaying every second of it.

Stop Replaying is the system for that.
Turn 3 days of rumination into 10 minutes of processing.

WHAT YOU GET

Stop Replaying E-Book + 30-Day Implementation Workbook
